Organization

The Science Museum of Minnesota conducts scientific research and provides hands-on learning experiences to the public through its exhibits, programs, and the facility itself.

Intern Project

Explore both immediate and long term opportunities for institutional water innovation and conservation.

Incentives to Change

The museum aims to not only advocate but also embody the technologies, norms, and practices of innovative water management in the 21st century.

Solutions

Provide dual-flush toilets

that allow guests to consciously choose to conserve water by flushing with a lower volume of water.

Reduce the number of days and the amount of time

the museum's landscape is irrigated each week to reduce the total volume of water devoted to irrigation.

Collect rainwater on the roof

and use it to irrigate the museum's landscape instead of purchasing potable water.
